1. What's New in WinTid Version 2026.02.1

WinTid version 2026.02.1 was released on February 3rd, 2026.

1.1 Access Level for Program Functions

It is now possible to set an access level on program function setups. This makes it possible to restrict which users can view and assign the different program function setups.

Access level is set in System settings – Program functions setup. Level 1 is the highest level. Users can only view program function setups at the same or lower level than their highest assigned level, so if the highest assigned level is 2, they will see levels 2, 3, 4, etc. Program function setups with no level are visible to all users.

When assigning program functions to a user in Personnel – Personalia – Account and WinTid-access or in Personnel – Administratives that do not register time, only program function setups that the logged-in user has access to based on access level are shown. Program function setups that are already assigned to the user, but which the logged-in user does not have access to, are shown greyed out.

Note that all program function setups are visible in System settings – Program functions setup, regardless of access level, so only administrators should have access to this page.
